FOR ORTHODONTISTS, DENTISTS AND THE TEAMS WHO SUPPORT THEM

EVERY PATIENT SAYS THEY WORE THEM. THE TEETH TELL A DIFFERENT STORY.

Clear aligners only move teeth when they are in the mouth. Yet wear time, the single variable that decides whether a treatment plan becomes a result, is the one clinicians control least and measure worst.

Patients are not simply lazy, and most are not lying on purpose. They are human, and human behaviour follows predictable patterns: optimism about their own habits, the pull of the present moment, the wish to give the answer the doctor wants to hear, and motivation that fades as soon as the novelty does.

In **They Say They Wore Them**, Dr. Enzo Pasciuti brings the psychology of behaviour into the operatory, explaining why compliance breaks down and how to design treatment so that it doesn't.

INSIDE YOU WILL DISCOVER

- Why patients overestimate their wear time, and how to recognise non-compliance before it derails a case
- The psychological drivers that make motivation rise and fall over the course of treatment
- How to communicate expectations at consultation, delivery and every check-up
- Practical clinical protocols for monitoring, refinements and getting off-track cases back on course
- How to build a practice system where compliance becomes the default, not the exception

Because the best treatment plan in the world only works if the aligners are actually worn.

ABOUT THE AUTHOR

Dr. Enzo Pasciuti is the founder of Pasciuti Orthodontics and of the Enzo Pasciuti Academy, where clinicians learn to combine sound biomechanics with an understanding of the people wearing the appliances. This book distils that approach into a method any practice can apply from Monday morning.
